

Faculti Summary

<https://faculti.net/mixing-methodsmodelling-teamspractice-of-or/>

This video discusses the concept of "wicked problems" and "grand challenges," highlighting their complexities and the need for a collaborative approach among various stakeholders. Wicked problems are characterized by their messy nature, multiple stakeholders with differing viewpoints, and no clear solutions. Grand challenges, described as "super wicked problems," build on these characteristics while introducing additional layers of complexity, including longer timeframes and broader stakeholder involvement.

The speaker emphasizes the importance of engaging diverse stakeholders not just for their knowledge, but also to ensure buy-in for necessary changes. They outline key characteristics of wicked problems, such as the lack of definitive solutions and the dynamic, interconnected nature of the issues at hand.

The speaker also discusses their involvement in developing a mental health network, which entails integrating a wide range of professionals and consumers involved in mental health care. They highlight using established theories, such as situated learning, to foster collaboration and enhance practice relevance.

A methodological framework involving interviews and workshops is described, which helps gather insights from different stakeholders and facilitates a better understanding of the mental health landscape. The resulting "four pillars framework" serves as a foundation for addressing grand challenges in mental health practice, focusing on purpose, governance, membership, and demonstrating value.

In conclusion, the speaker reflects on the difficulties of sustaining engagement over time and the necessity of fostering knowledge among participants to navigate and manage complex challenges effectively. They emphasize the role of technology in facilitating communication and collaboration while also recognizing the importance of context in choosing appropriate methods and tools for engagement.
